Pulmonology consultation

Patient ID: SYN-004

Document date: 2025-05-06

Consultation summary

Ms. Roe is seen in follow-up for a respiratory illness. In March 2025 she developed dry cough and exertional dyspnea while receiving FOLFOX for colorectal cancer. CT chest showed bilateral ground-glass and reticular opacities. Infection was excluded, and she was diagnosed with drug-induced interstitial pneumonitis, felt to be oxaliplatin-related. Oxaliplatin was permanently discontinued and she completed a prednisone taper in April 2025. She is now asymptomatic. Plan: avoid oxaliplatin; repeat pulmonary function tests in one year.
